

WHY LOWDECK?

- Extremely low total build up
- Perforated, multi-directional channels speeds up installation time
- Small, manoeuvrable panels are easy to handle on site
- Foil layer gives excellent heat output

PRODUCT DESCRIPTION

At only 15mm, LowDeck is the perfect choice for projects needing a lower build up without compromising heat output and warm up times. LowDeck is also particularly suited to retro fit projects as it can be installed over existing structural floor decks.

Made from high grade wood, the LowDeck panels provide a strong base for floor finishes to be applied on top. Furthermore, as LowDeck is a completely dry construction, the floor finish can be immediately installed over the top making the total installation time extremely quick. Seek suppliers' advice for specific floor build up to suit their product

The aluminium foil layer helps to distribute the heat evenly and gives the system a high heat output. The foil also replaces the need for separate spreader plates, considerably speeding up the installation. What's more, the perforated foil also displays the pipe channels with perforations to make it easy to see where to fit the pipe.

SPECIFICATION

Product: 15mm Woodboard

Panel dimensions: 800mm x 400mm x 15mm

Pipe: 12mm PE-RT

Pipe centres: 133mm
